

AI STUDIO MASTER PROMPTING & ARCHITECTURE BLUEPRINT

Aapke har task ko 1st turn me 100% perfect, super-fast aur bug-free banane ka guide

1. KYUN ERRORS AATE HAIN? (ROOT CAUSE & SOLUTION)

- A. Development vs Vercel Difference: AI Studio me ek live Node backend hota hai.
Lekin Vercel ek static SPA host karta hai. Agar code dono jagah sync na ho,
toh Vercel purana static code hi load karta rehta hai.
- B. Mobile Viewport & Crop: Desktop par cards wide hote hain, lekin mobile par narrow.
Square photos ke top/bottom crop ho jate hain agar object-position lock na ho.
- C. Browser LocalStorage: Mobile browsers purane version ko cache karke rakhte hain.
Isliye har update ke baad storage version bump karna zaroori hota hai.

2. THE 4 GOLDEN RULES OF PROMPTING (AI Ko Kaise Command Dein)

Rule 1: Ek Saath Poora Context Dein (Clarity Over One-Liners)

Sirf "photo theek karo" mat boliye. Boliye: "Gymnastic photo ka position mobile view me 5% karo, static fallback me sync karo aur GitHub par push kar do."

Rule 2: Hosting Platform Specify Karein (Vercel / Netlify / VPS)

Prompt me add karein: "Ye site Vercel par live hai, toh Single Source of Truth banao taaki static build me backend JSON aur frontend TS me koi mismatch na rahe."

Rule 3: Mobile-First Framing & Aspect Ratio Mention Karein

Photos aur videos ke liye: "Mobile screen par check karke framing (xPosition, yPosition) lock karo."

Rule 4: Zero-Friction Execution Directive

End me ye sentence hamesha jodiye: "compile_applet verify karo aur git push origin main karo."

3. WEBSITE SHURU KARNE SE PEHLE KA PLANNING BLUEPRINT

- 1. Purpose & Target: Dance academy website for students & parents to book demo classes in Ranchi
- 2. Branding & Colors: Primary: #0066FF, Dark text: #0A0A0A, Transparent logo, Plus Jakarta font
- 3. Page Hierarchy: Navbar -> Hero (Video) -> Banner -> Categories -> Achievements -> Reviews -> Footer
- 4. Performance Budget: React.lazy for modals, preload auto on videos, 60fps smooth rAF scroll.

READY-TO-USE COPY-PASTE PROMPTS (100% 1-SHOT SUCCESS)

In prompts ko direct copy karke bhejein - kaam pehli baar me bina galti ke hoga

PROMPT 1: PHOTO / VIDEO YA FRAMING BADALNE KE LIYE

Is [Photo/Video] ko update karo. Iska mobile framing (xPosition, yPosition) check karke desktop aur mobile dono ke liye lock karo. Static fallback (DEFAULT) aur JSON data dono me sync karo, storage version bump karo taaki mobile par turant dikhe, aur git push origin main karo.

PROMPT 2: ULTRA FAST & SMOOTH 60FPS OPTIMIZATION

Website ki speed aur smoothness optimize karo: Heavy modals ko React.lazy + Suspense se code-split karo, background videos par preload="auto" aur fallback poster lagao, scroll listeners ko requestAnimationFrame se throttle karo, unused code clean karo, aur push origin main kar do.

PROMPT 3: NAYA FEATURE YA SECTION BANATE WAQT

Naya [Section ka naam] component banao. Modular architecture rakho, Tailwind CSS se mobile-first design karo, TypeScript interfaces strict rakho, single source of truth follow karo taaki Vercel par koi mismatch na ho, verify compile_applet karo aur git push origin main karo.

MASTER MANTRA: Single Source of Truth + Mobile Framing + Git Push

1. Single Source of Truth: JSON data aur TS fallback hamesha synced rahein.
2. Mobile Framing: Har photo/video ka framing phone view par verified ho.
3. Git Push: Har task ke end me auto-commit & auto-push ho jaye bina bole.
